*Source: National Software Testing Laboratory (NSTL), 12/97. Results based on differences in application load times on identical hardware systems running Windows® 98 versus Windows 95. Systems with Windows 98 used the FAT32 file system and were optimized with the Windows 98 Maintenance Wizard. These results are averages obtained from launching multiple applications on a variety of PCs, with processors ranging from 486/66 MHz to Pentium 200 MMX, with 32 MB of RAM. Your own results will vary depending on your system configuration. Best results are obtained with faster processors.

**Results based on testing 200 users' hard drives and calculating the space gained by converting from FAT16 to FAT32. Requires a 512 MB hard drive or larger to convert to FAT32. Actual experience will vary depending on hard drive partition size and number of files in your system. Hard drive partitions in excess of 1 GB and/or a large number of files yield the best results.
